

Guidelines for final project presentation:

1. Each group/pair will make a presentation, which should show the following:
 - Brief discussion/review of problem statement, objectives, hypothesis and model definition
 - Actual simulation of model (highlight important use cases, based on your hypotheses)
 - **Results and Discussion** – Present here your analysis of simulation result, by means of employing necessary statistical tests applicable to your simulation (HINT: you can check for variable correlations especially if your goal is to discover if an independent variable is affected by a dependent variable. If using NetLogo: you can utilize NetLogo's Behaviour Space to run the model several times in an automated manner. You can use R to integrate it with NetLogo for an easier and faster facilitation of statistical analysis based on your results). Consider this as the heart and soul of your presentation. This is the most crucial part of your work, so it is important that you can correctly interpret and explain your results, ensuring that valuable results can be concluded based on your experimentations done. If you have a statistician friend at your disposal, please do not hesitate to reach out and seek advice from them on this matter.
 - **Conclusion** - Conclude your presentation by summarizing your findings based on your analysis. Revisit your problem statement and objectives and see if your model created was able to address them. This should be reported in your conclusion. Summarize overall findings and main points of your work.
 - **Recommendation/Future Work** – Any recommendations for further improving the work that you did should be specified here. Constraints, scope and limitation of your work should be stated here. Agree on a plausible recommendation that you feel will further improve the current simulation done.
 - **Make your presentation as concise and straight to the point while not missing out important details.** Allot 10-15 mins for your entire presentation, so that Q&A can be done in 5 mins.
2. Since your presentation can feel a bit condensed and pressed for time, you are also required to submit a paper based on the entirety of your work done, similar to a conference proceeding/journal article paper. Overleaf has already an official template on the conference proceeding of ACM which can be found here: <https://www.overleaf.com/latex/templates/acm-conference-proceedings-primary-article-template/wbvngjhjbzwpc>. Organize your paper with the following format: Abstract, Introduction, Related Works, Materials and Methods, Results and Discussion, Conclusion and Recommendation, and References. Spare no details here! Include sample screenshot(s) of your simulation in your writeup. Submission should both be in pdf and the actual link of the raw LaTeX file. Kindly indicate in your paper (at the end or as a footnote) the work done by each individual, e.g. *Juan de la*

Cruz did the model conceptualization and design, Bongbong Marcos did the paper, and Sara Duterte did the coding in NetLogo.
